Alzheimer Disease is far more common in adults with Down Syndrome, but not every person with Down Syndrome will get Alzheimer Disease.

Our study wants to find out more about the development of Alzheimer Disease in people with Down Syndrome, and you can help!

We ask parents/caregivers to answer questions:

- About the adult’s daily functioning
- About signs of dementia

We ask the adult with Down Syndrome to:

- Play memory games
- Let us take pictures of his/her brain using MRI
- Provide a DNA sample
- Get compensated for his/her time ($20 per hour)
