Executive Function in 7 to 16 yr. old Children with Cochlear Implants

Executive Function abilities are a group of thinking skills that help people plan, problem solve, and set goals. Measuring and knowing your child’s executive function profile might help his/her educational team plan for success.

Parents and their child with cochlear implants will be asked to:

- Call for a screening interview & appointment
- Come for one 2 hour visit to Vanderbilt Bill Wilkerson Center
- Parents will answer questions about their child and family
- Children will participate in game-like screening and testing
- Children will pick a book or toy.
- Parents will get a report concerning their child's language and thinking skill strengths and weaknesses after the visit.
