WHAT ARE WE STUDYING?
We are studying whether the drug divalproex sodium is able to improve behavioral and neurological symptoms in children with Autism Spectrum Disorders (ASD).

WHO CAN PARTICIPATE?
- Children 4—8 years old
- Diagnosed with Autism Spectrum Disorders (ASD)
- EEG findings that qualify for the study**

WHAT DOES THE STUDY INVOLVE?
Participation in the study lasts ~30 weeks (7 months). During one half of the study the patients will receive the active drug. In the other half, they will receive placebo.

Participation includes:
- 10 study visits
- 3 overnight visits
- Weekly phone calls to monitor progress

Study visits may involve:
- Behavioral and neurological testing
- Physical exams & medical history
- Blood draw to monitor study drug levels

There is compensation for your participation in this study.

**Will be confirmed in initial screening visits
